Executive finding. Tata Motors begins this analysis as India's passenger-EV leader, but its lead is increasingly contestable. The attractive opportunity is to convert urban, value-conscious buyers and fleets through credible total-cost economics, dependable charging access, and a broader product/service proposition—not simply a larger vehicle range.

Market context

Indiasold 2.008 million EVs in 2024, up from 50,000 in 2016. Yet EVs represented only 7.66% of Indian vehicle sales in 2024, versus 16.48% globally and India's stated 30% 2030 ambition. The market's near-term volume is led by two- and three-wheelers; passenger electric cars are a smaller but strategically visible segment.

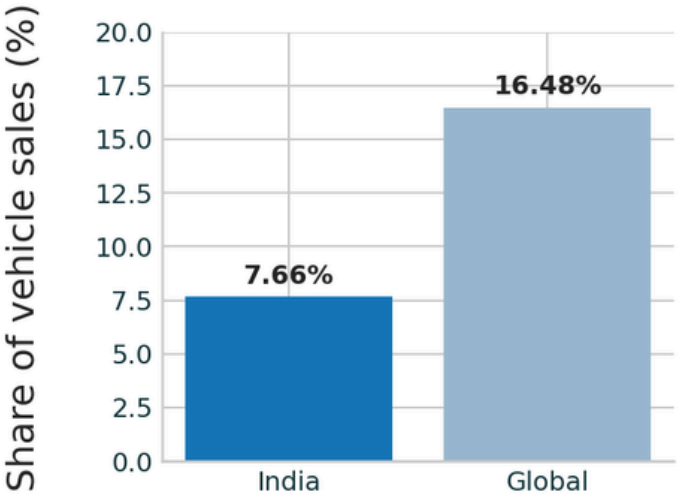

Sourceforchart:NITIAayog,Electric Vehicles in India (Aug. 2025), using VAHAN data. Figures are annual registrations/sales in thousands.

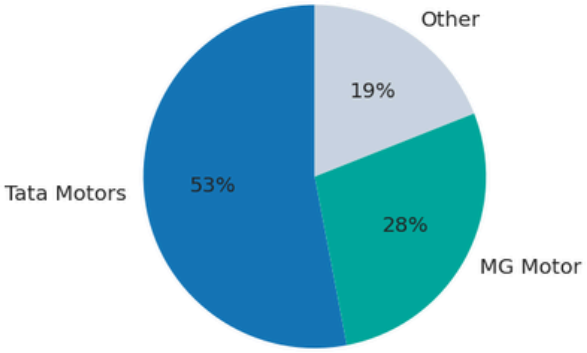

Investment lens

The categoryhasa structural tailwind—fuel-import reduction, urban air quality, lower operating cost and policy support—but execution determines value. NITI Aayog identifies charging availability/utilisation, high upfront cost, weak awareness, financing and data/regulatory gaps as the major adoption frictions. PM E-DRIVE, launched in 2024 and operational through 2026, has an allocation of ■10,900 crore.

Competitive position

Tata Motors heldan estimated 53%ofIndian e-car sales in FY2025, while MG Motor held about 28%. This is a leading position,
not a protected one: incumbent automakers and new EV-native offerings can narrow the gap through design, features, price, retail finance and charging partnerships.

Sources for charts: NITI Aayog (penetration); JMK Research, Annual India EV Report Card: FY2025 (e-car shares). FY2025 is Apr. 2024–Mar. 2025. “Other” is the balance, notasinglecompany.

Target audiences

Segment	Need / buying trigger	Recommended Tata.ev response
Urban first-time EV households	Affordable mobility, predictable monthly cost, home/apartment charging	Entry/mid-price products; TCO calculator; finance and residential charging support
Premium urban families	Design, range confidence, safety, technology	Distinctive EV architecture; fast-charge journey planning; ownership concierge
Corporate, taxi and last-mile fleets	High utilisation, uptime, operating cost, centralized charging	Fleet bundles: vehicle + charger + service SLA + financing
Existing Tata / ICE owners	Trusted service and low switching risk	Trade-in, battery warranty clarity, dealer test-drive conversion

Competitor map

MG Motor: the closest scaled challenger by FY2025 share; likely competes directly on product value and features. **Mahindra:** a domestic rival positioned to contest higher-value SUVs and EV-led brand consideration. **Hyundai/Kia:** established ICE brands with dealer reach and product credibility. **BYD and luxury OEMs:** smaller-volume benchmarks for technology and premium positioning. The practical competitive set varies by price band and city; share alone is not a substitute for model-level comparison.

SWOT analysis

Strengths	Weaknesses
• FY2025 e-car market leader at ~53% share • Domestic brand recognition and existing service/dealer footprint • Early-mover learning in mass-market EVs • Portfolio and ecosystem credibility can reduce buyer risk	• Leadership is concentrated in a still-developing e-car category • Upfront-price sensitivity remains acute for Indian consumers • Customer experience depends on charging reliability outside Tata's direct control • Battery supply, residual-value and technology-perception risks
Opportunities	**Threats**
• Convert high-use fleets where lifetime operating economics are clearer • Make apartment/home charging and financing a packaged service • Expand into urban clusters with dense charging and aftersales coverage • Monetize software, service plans, certified used EVs and battery lifecycle services	• MG and other OEMs reduce the product/feature gap • Slower charging build-out or poor utilisation weakens confidence • Policy/incentive changes and raw-material volatility pressure demand/margins • Safety incidents, battery degradation concerns and resale anxiety damage category trust

Market trends that matter

1.**Scale, butunevenly.**EV sales expandedsharply, but India's 2024 EV penetration remained far below its 2030 ambition. This

rewards targeted conversion rather than assuming broad, immediate adoption.

2. **Infrastructure is an experience issue.** NITI Aayog describes both inadequate charging and low utilisation of existing public sites, alongside land, power-connection, price and fragmented-payment challenges. Reliability and discoverability matter as much as charger counts.

3. **Economics shift from purchase price to TCO.** High capital cost is a barrier; fleets, lease/battery-service constructs and transparent operating-cost comparisons can lower adoption friction.

4. **City clustering is preferable.** NITI Aayog recommends saturation in limited geographies rather than thin national distribution. Tata should prioritize cities/corridors where service, home charging, fleet demand and public fast charging reinforce each other.

5. **Segment selection matters.** India has progressed more in electric two/three-wheelers than cars; passenger EV growth should be assessed independently rather than inferred from total-EV headlines.

Strategic recommendations

1.Win theownershipjourney.Bundle vehiclefinance, home/apartment charger facilitation, public-charging access, roadside

support and a battery-health/resale commitment. This directly targets range, resale and service anxiety.

2. Build city “EV confidence zones.” Select a limited set of high-potential urban markets, then coordinate retail inventory, mobile service, fleet partnerships, test-drive events and interoperable fast-charging coverage. Measure conversion and uptime by city.

3. Make TCO tangible. Use verified, local-use-case comparisons—not generic fuel-saving claims—for commuters and fleets. Show finance payment, charging cost, maintenance assumptions, warranty and resale conditions.

4. Defend the mid-market while creating upgrade paths. Protect value leadership in accessible price bands, while using differentiated software, design and service to retain customers as competitors introduce new SUVs and feature-rich products.

5. Use fleets as a learning engine. Offer uptime-based packages to corporate, taxi and urban logistics fleets. High-utilisation use cases generate operational data and charging demand that can improve retail planning.

Key KPIs

Priority	Measure
Demand conversion	Test drive → order; EV enquiry → order; finance approval rate; city/model mix
Ownership confidence	Home-charger installation time; public-charging success rate; service turnaround; NPS
Economics	Real-world cost/km vs customer expectation; warranty claims; certified-used residual value
Competition	Model-level share by city/price band; conquest rate from rival brands; cancellation reason

Method and sources

Thisdesk-research report assessesTata Motors’ passenger-EV position in India. It uses the latest complete, cited public figures available in the source set;

FY2025 shares and 2024 national market data should not be read as live 2026 trading data. SWOT points and recommendations are analytical inferences based on the cited market evidence.

• NITI Aayog (Aug. 2025), Electric Vehicles in India: Unlocking a $200 Billion Opportunity. Source data cited therein include VAHAN and IEA. Key figures used: 2.008m India EV sales in 2024; 7.66% India penetration; 30% 2030 target; adoption barriers and policy recommendations.

• JMK Research (FY2025), Annual India EV Report Card. Key figures used: e-car sales +~11% YoY; Tata Motors ~53% and MG Motor ~28% of e-car sales.

Prepared 5 October 2026 • Educational market-research use • All ■ figures are Indian rupees.
